SanMar

WooCommerce Product Integration

WooCommerce Product Integration

SanMar has no affiliation with any third-party plugins and does not offer support for plugins. SanMar is not responsible for any issues that might result while using this software.

This guide shows you how to use the WP All Import Elite plugin to bulk import SanMar product data into your WooCommerce store. WP All Import Elite is a WordPress plugin designed to let you import large amounts of data (for example, CSV, Google Sheets, and XML) into your WooCommerce store.

Prerequisites

WooCommerce: You must have the latest version of the WooCommerce plugin installed.

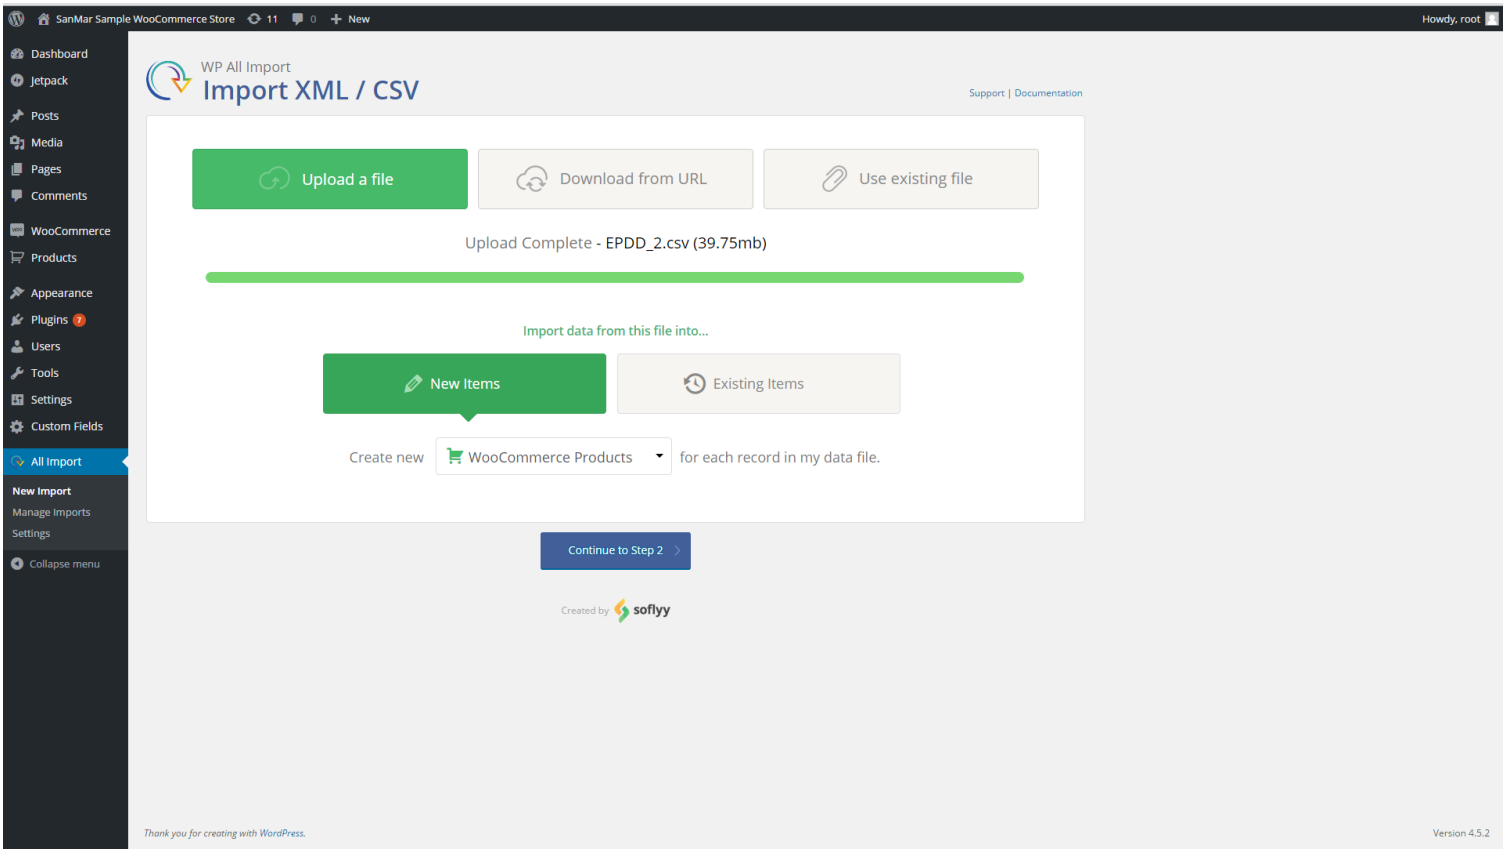
WP All Import Elite: You can purchase this plugin from the WP All Import website. If you have the free version of WP All Import, you must uninstall it before you install the WP All Import Elite bundle.

SanMar Product Data: You can download SanMar product data in CSV format from the SanMar Data Library. You can download the entire product data file, or you can use the customized SanMar Data Library to download specific styles, categories, or brands.

WP All Import: Mapping Fields

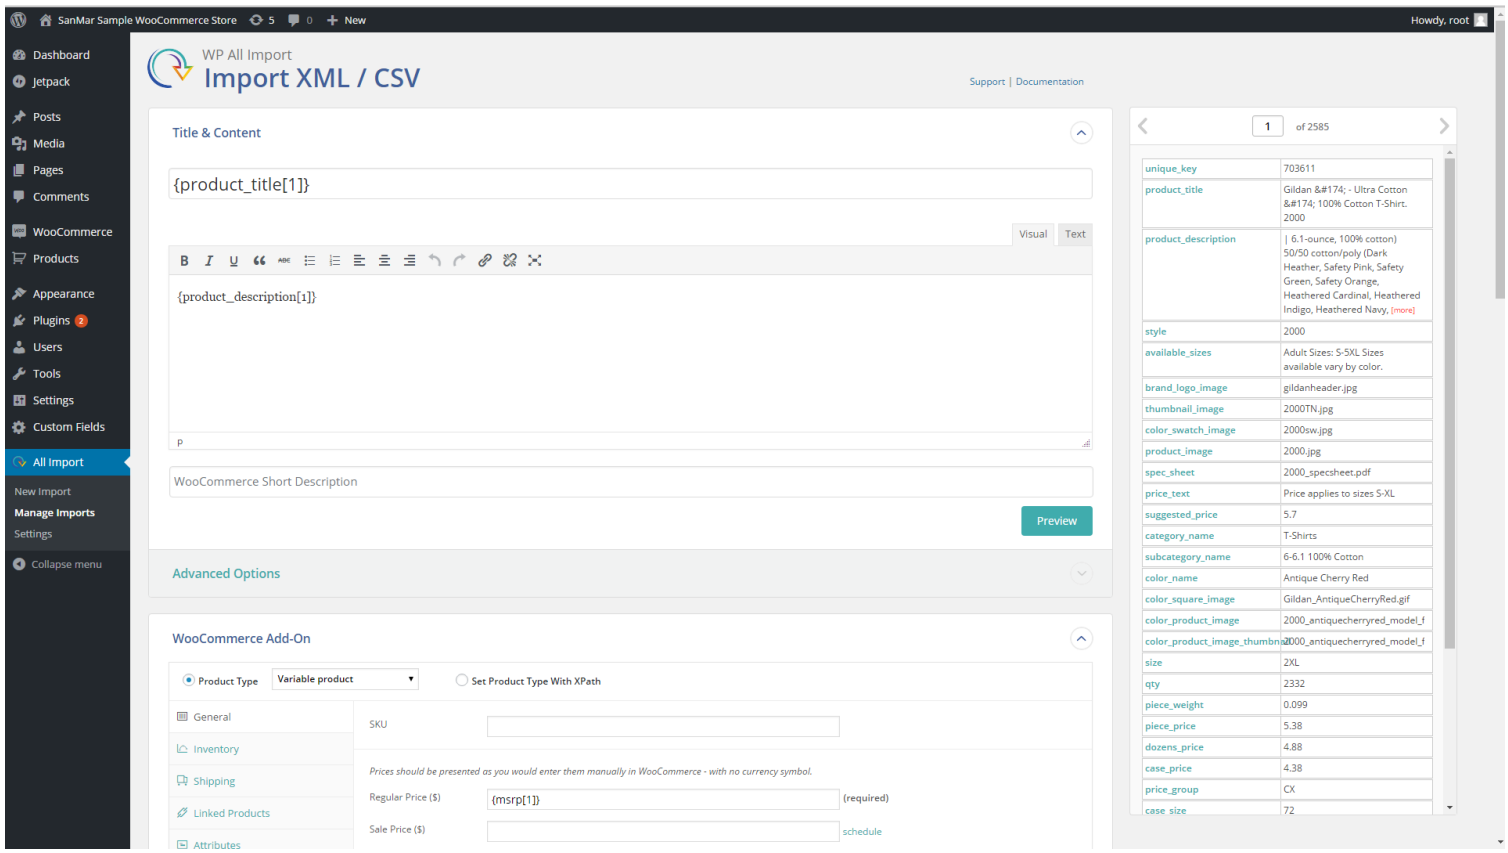
Step 1:

Select **All Import** > **New Import** > **Upload a file**. Choose the EPDD_2.csv from the location where you downloaded it. After the upload completes, select **New Items** > **WooCommerce Products** from the drop-down menu. Once completed, select **Continue to Step 2**.



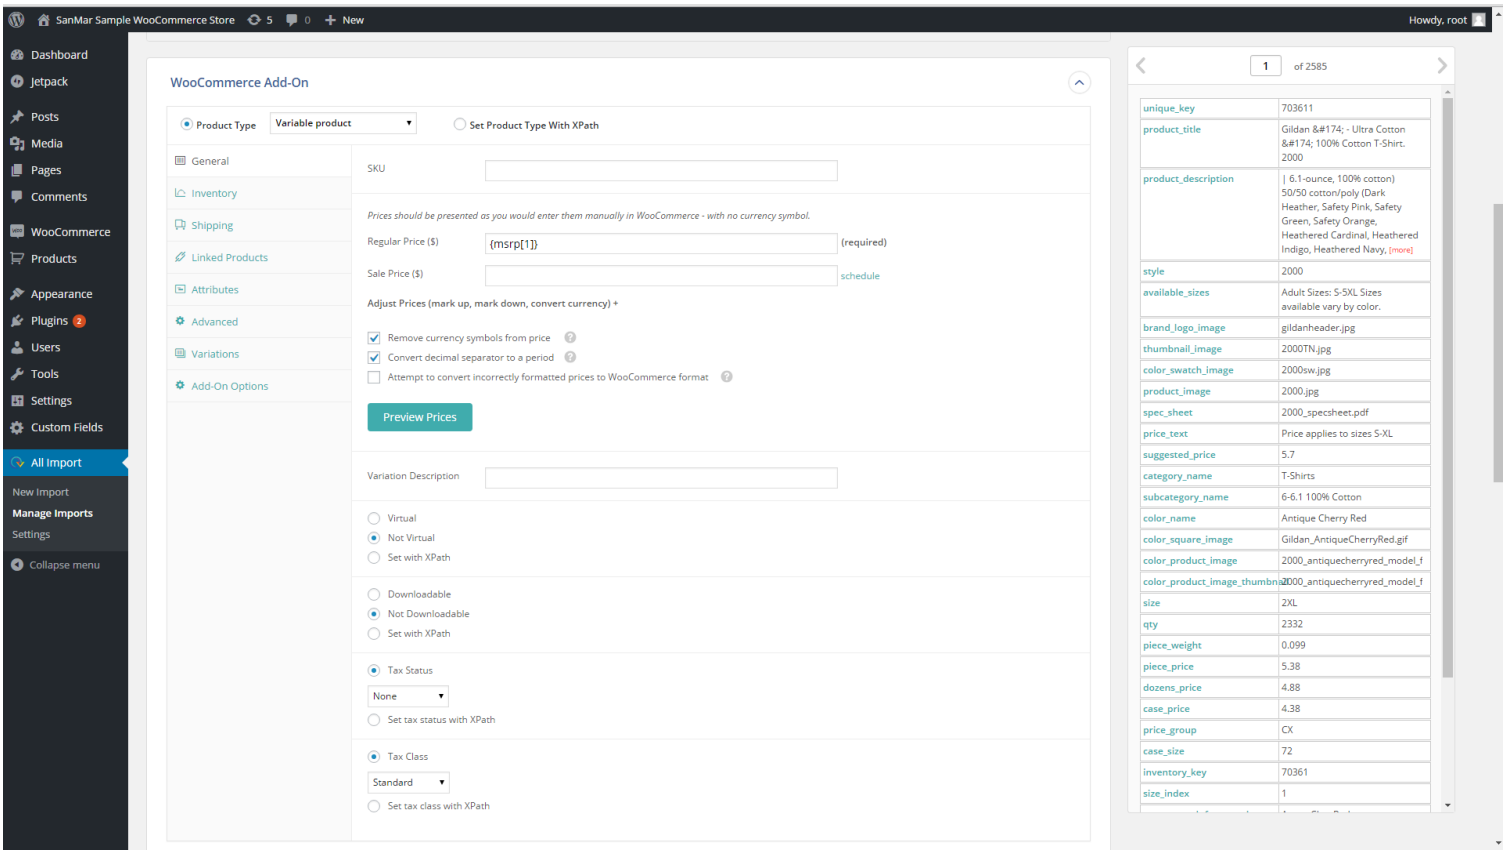
Step 2:

After you do a new import with the EPDD_2.csv file, you'll be able to map the fields. You can drag and drop categories on the right to their respective fields on the left. Drag and drop the **product_title** category from the right to the **Title and Content** field. Drag and drop **product description** into the content field.



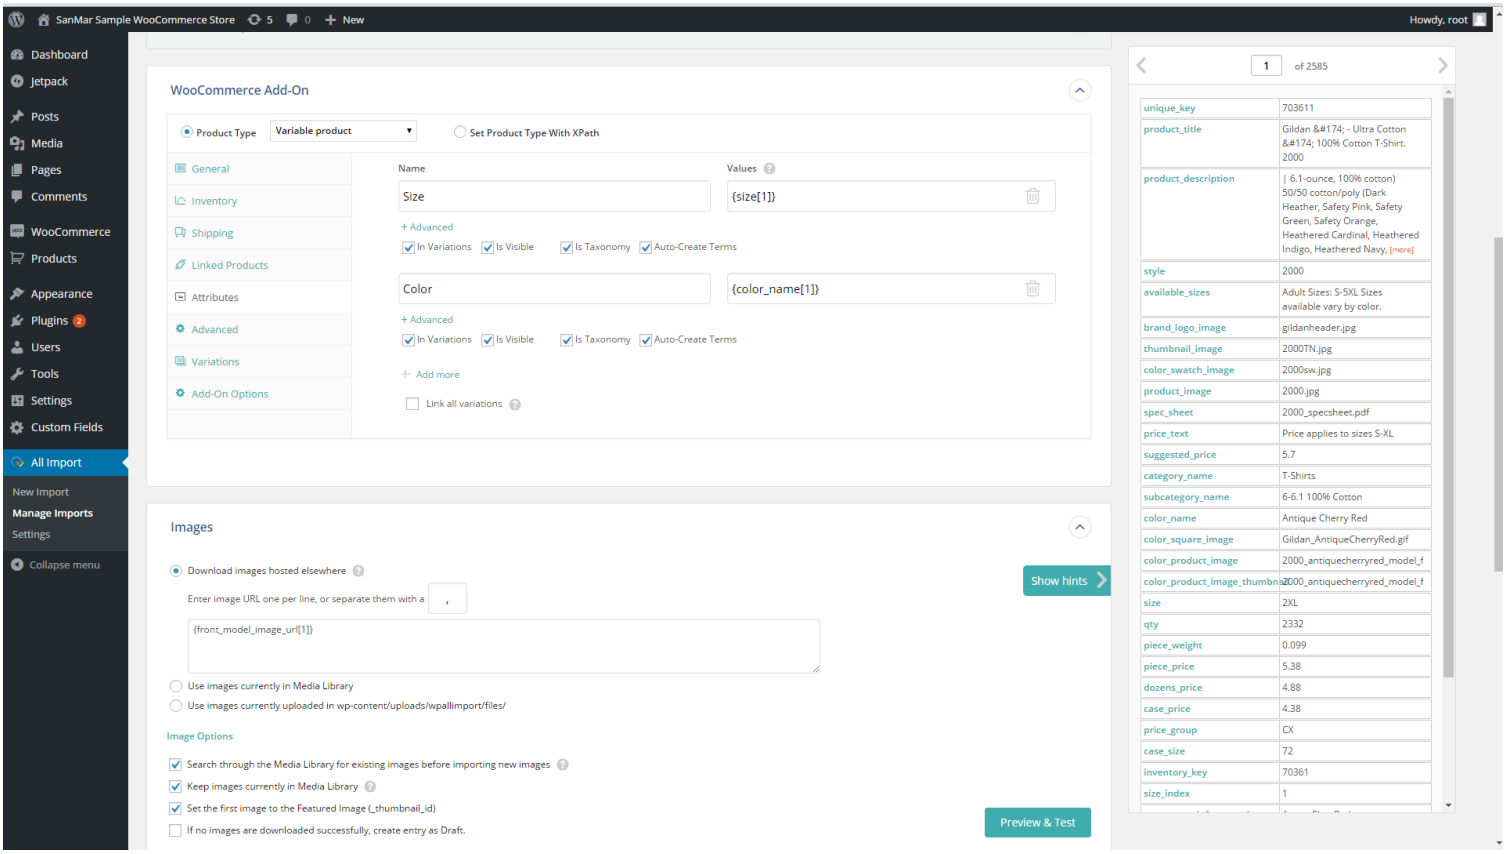
Step 3:

Scroll down to the **WooCommerce Add-On** area. Select **Product Type** and make sure **Variable Product** is selected from the drop-down. Drag and drop the **{msrp[1]}** category on the right to the **Regular Price** field on the left.



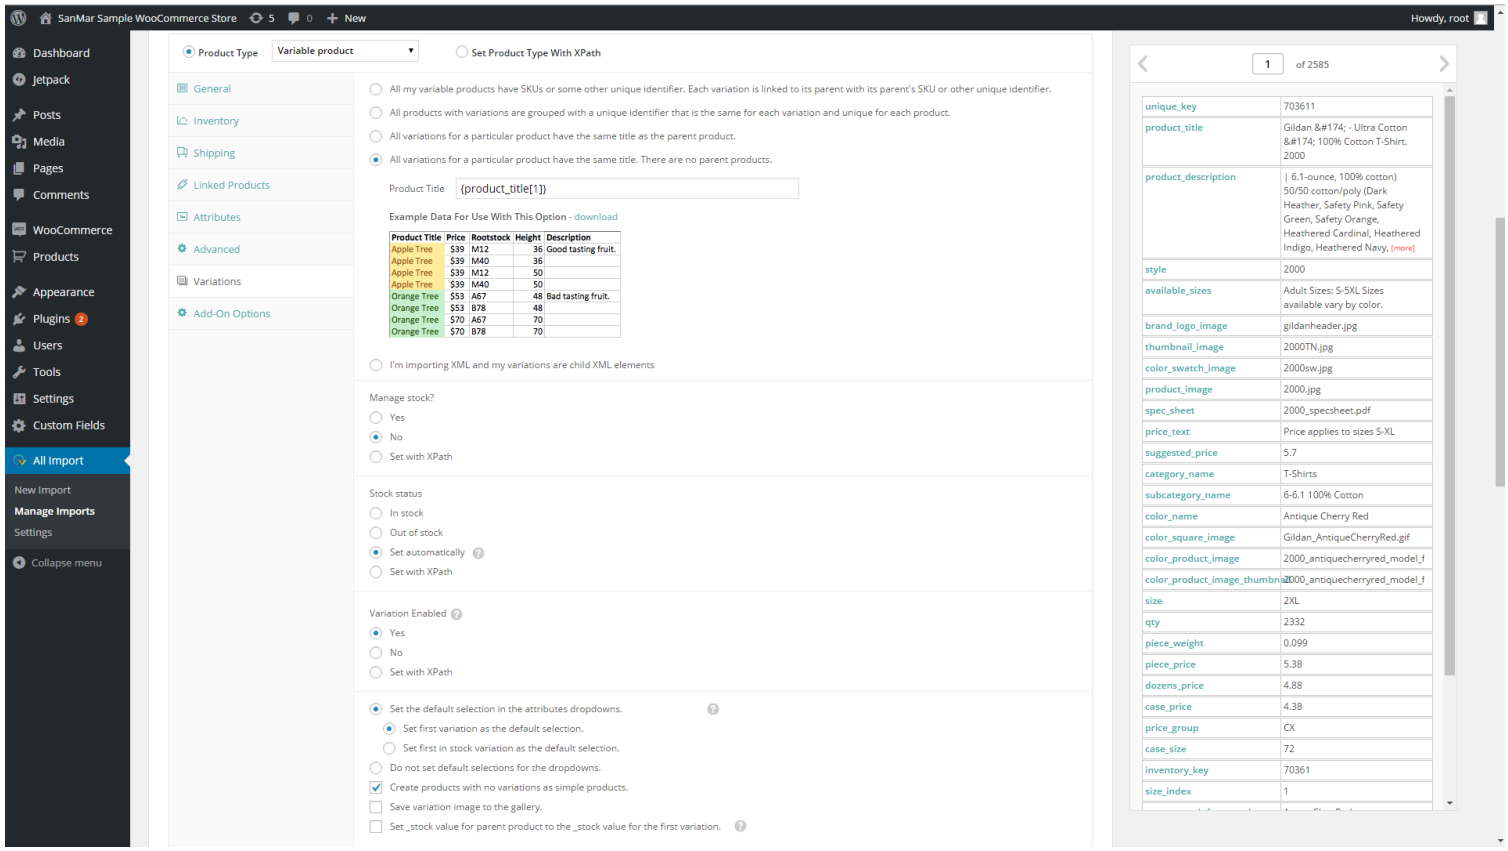
Step 4:

Select the **Attributes** category. Add an attribute for Size (**Name** = **Size**, **Values** = **{size[1]}**) and an attribute for Color (**Name** = **Color**, **Values** = **{color_name[1]}**). For **Images,** select **Download Images hosted elsewhere**, and type in (or drag and drop) **{front_model_image_url[1]}** .



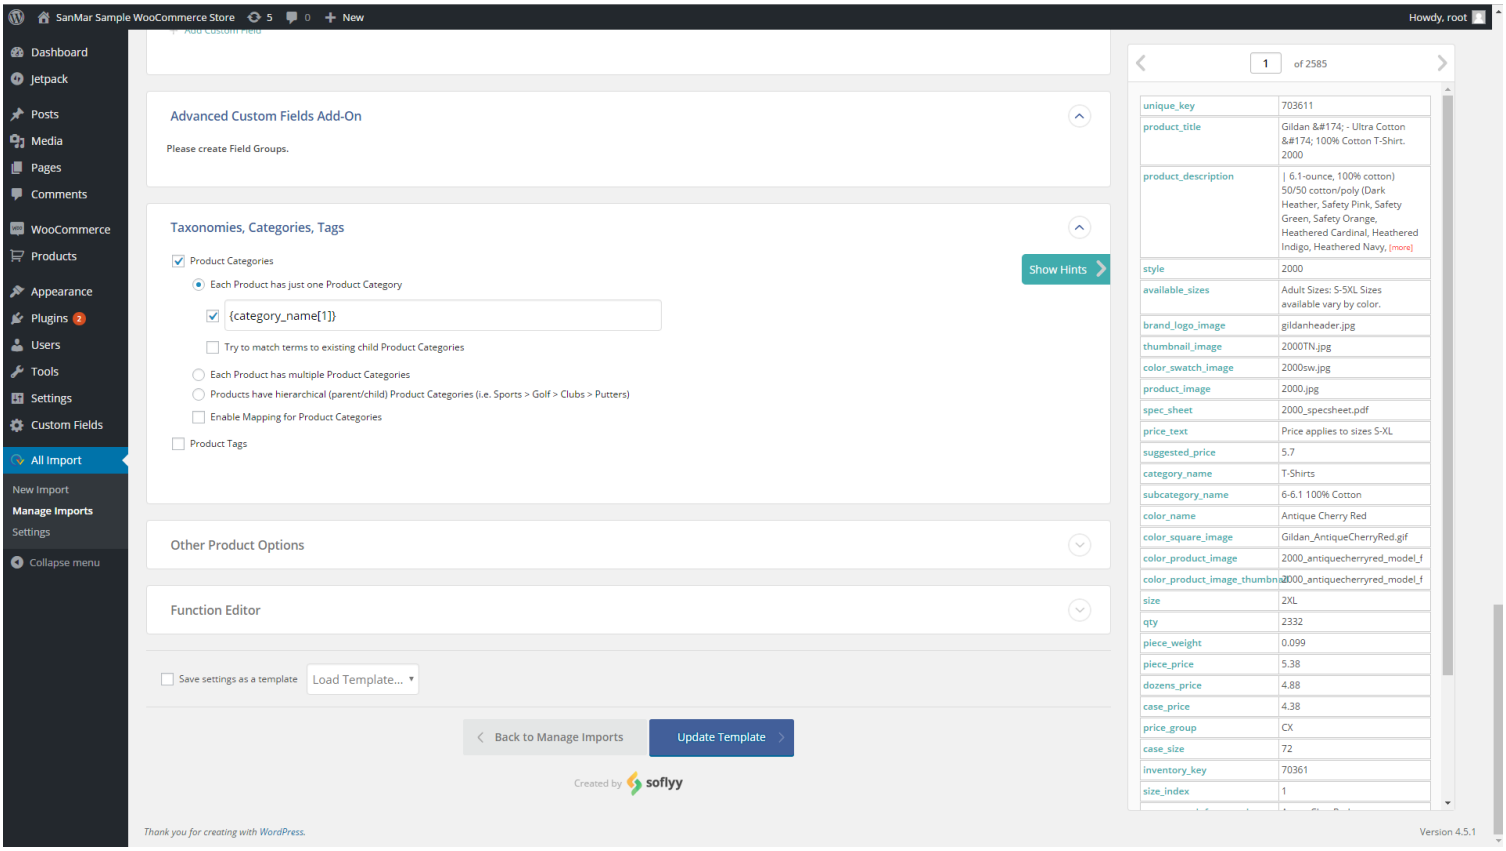
Step 5:

Select the **Variations** category. Select '**All variations for a particular product have the same title. There are no parent products**'. For **Product Title,** type in (or drag and drop) **{product_title[1]}** .



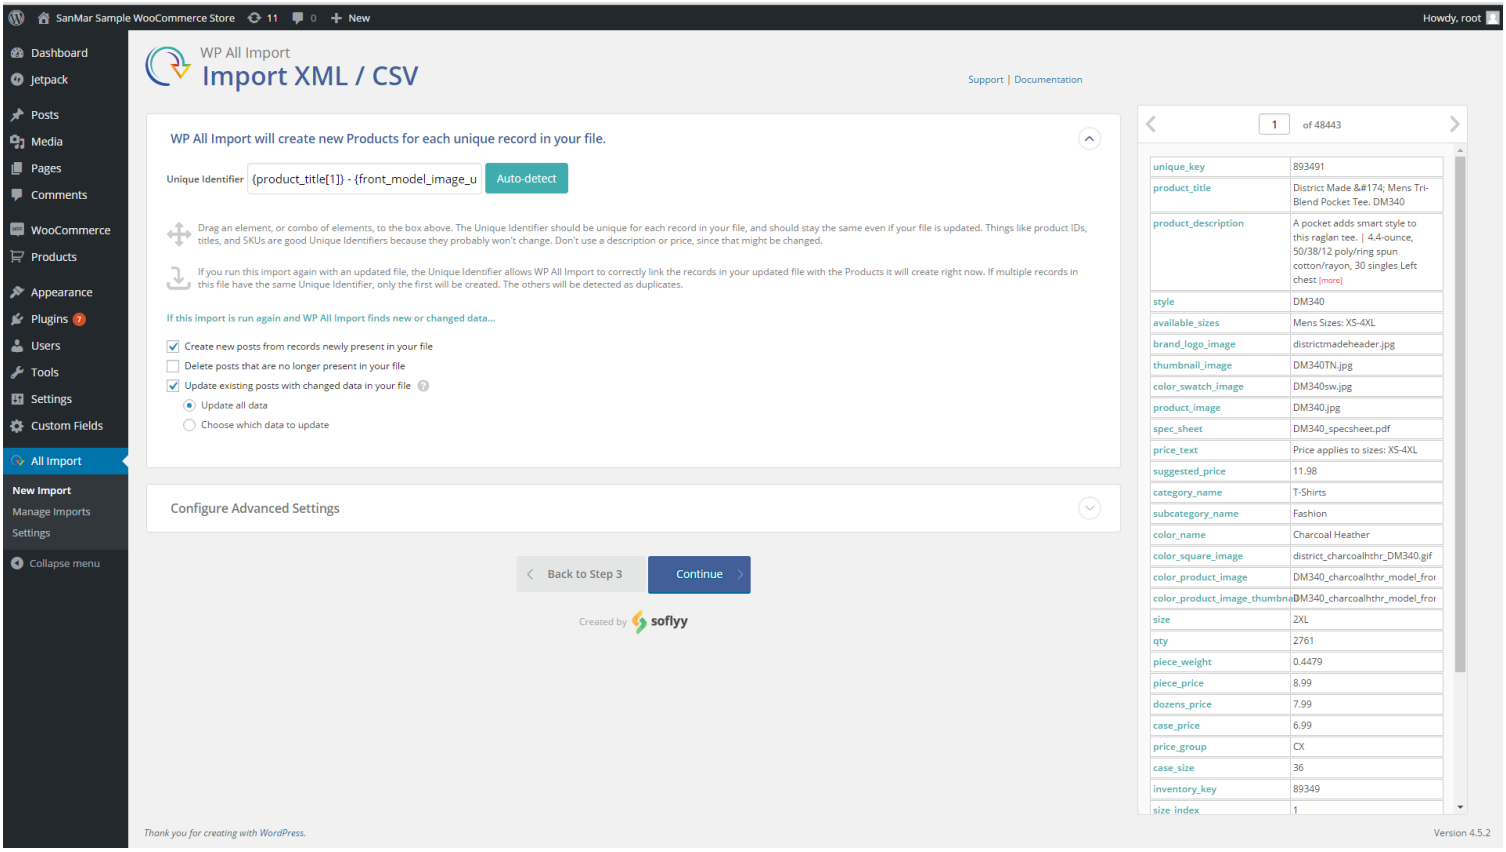
Step 6:

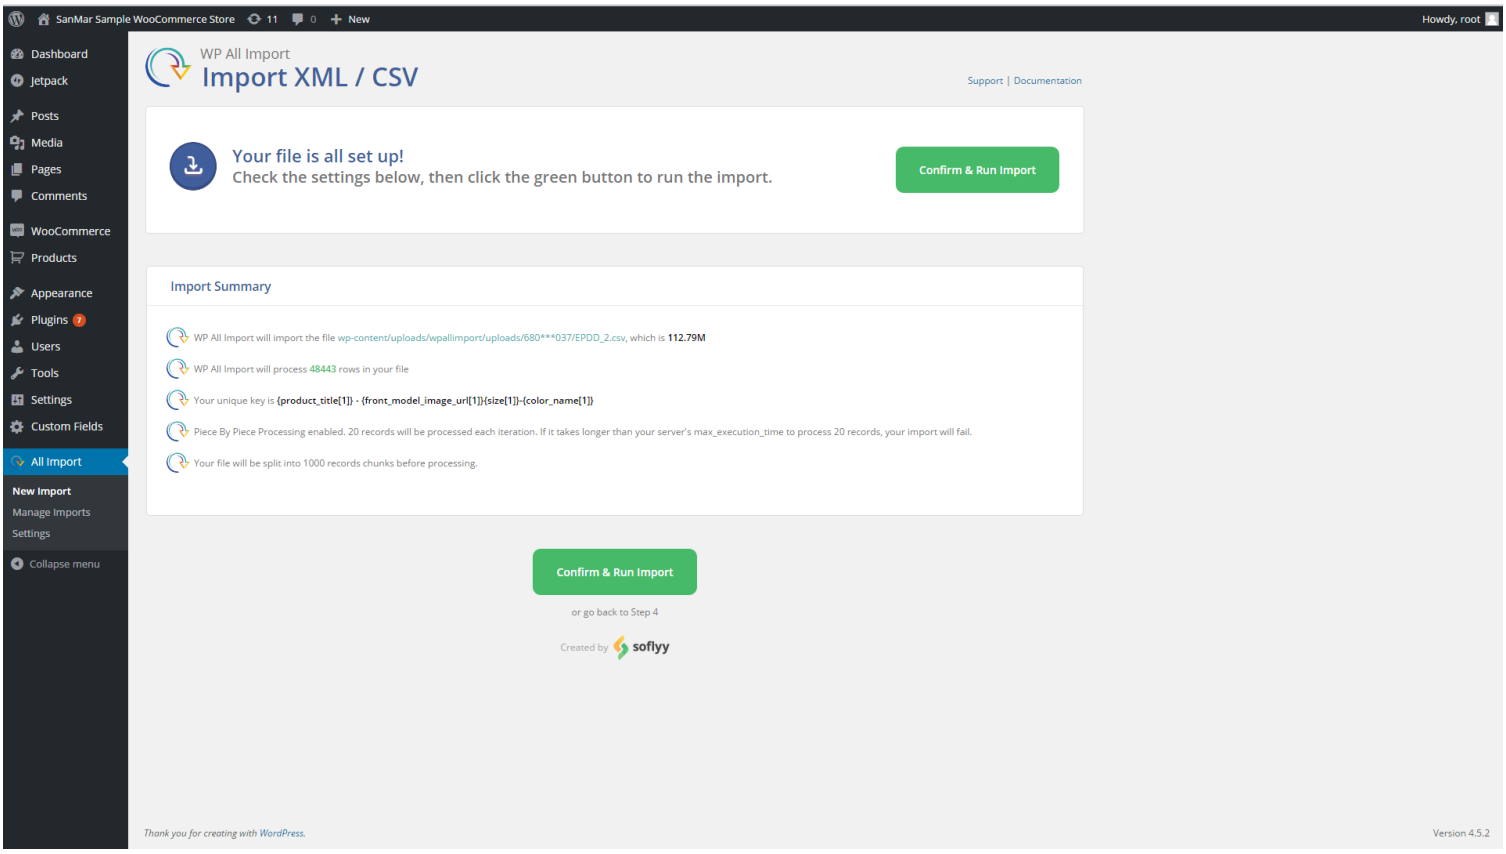
For **Taxonomies, Categories, Tags,** add a checkmark in **Product Categories**. Select **Each Product has just one Category,** and type in (or drag and drop) **{category_name[1]}** . Select **Continue to Step 4**.



Step 7:

For the **Unique Identifier,** select **Auto-Detect** and then select **Continue**.



Step 8:


Select **Confirm and Run Import** to import the data into your WooCommerce store.
